10:15 FUTURE BUILDING - Cooperative. Efficient. Digital

The construction industry is facing a turning point: How can we succeed in combining the innovative and disruptive business, process and product approaches of young companies with the in-depth expertise of construction companies? How can we use digital processes to build sustainably and economically successfully in the future? Our aim is to offer new business models good economic framework conditions. We want to give a voice to the new market players who are revolutionizing the construction market with new production and product approaches - we want to bring both worlds together.

16:15 Our strategy for a sustainable future: ecobuilding

Our strategy for a sustainable future: ecobuildings embody a revolutionary concept that aims to create neighborhoods that meet today's ecological, economic and digital requirements. Ecobuildings stand for efficiency, sustainability and innovation. Through digital architectural planning using BIM, prefabrication and a sustainable energy concept that our experts plan individually for each neighborhood, we are striving for a new era of planning and building. This not only protects the environment, but also saves costs and improves the quality of life for users: inside. In addition, we are creating virtually climate-neutral neighborhoods. You can find out more about the advantages of our ecobuilding concept in this presentation.

11:30 Together with its partner for digitalization in the construction industry, a vocational school is setting out to integrate the BIM way of working, including application-related software solutions such as the Autodesk Construction Cloud, into training.

BIM is currently only rarely represented in training courses in the main construction trade and further training courses represented. The vocational school for construction technology BS08 in Hamburg has taken on this topic as a major project for the coming years and has chosen NTI Germany as its partner for the introduction of the holistic approach of the BIM method. Jan Schafflik and Ines Lämmel report from their about the opportunities and challenges of integrating BIM into the classroom.

12:15 GIS-BIM Evolution : digital twins in the context of planning, building and operating.

Esri has been helping clients worldwide solve some of the most complex issues and problems with a geographic approach since 1969. In architecture, design, construction and operations, GIS-BIM integration leads to a better understanding of the project area and the influence of the geographical context on the BIM model - and vice versa.

Using various practical examples, we will show at the Construction Summit how GIS leads to a holistic understanding of the project or existing building across all service phases and which actions can be derived from the digital twin.

13:30 AI in construction cost management

The commercial management of the construction site and the associated ongoing monitoring of target and actual construction costs usually come more into focus in times of crisis. In practice, these activities relating to data collection and ongoing data maintenance are among the least favourite tasks of construction managers and other specialists. The machine learning-supported technology from reebuild enables detailed insights into your own construction costs while greatly reducing the effort involved in data collection.

13:45 Predictive quality monitoring in concrete: Enabler for costs and CO2 reduction

Sustainable concretes are the future of construction - but the production and use of these concretes poses a certain challenge for suppliers and construction companies. Sustainable concretes with a lower proportion of clinker or concretes with a high proportion of RC material are fundamentally more demanding. This presentation will focus on how such concretes can be successfully used with alcemy's close-meshed and AI-supported quality control.

10:00 FIRE ZINCING is durable and natural - The advantages of the marriage of zinc and steel for the sustainable building of tomorrow!

The marriage of steel and zinc at over 450 degrees extends the service life of steel construction products many times over. This is how the fight against the material marauder rust is declared. This protects values and creates surfaces for the future. Hot-dip galvanized steel is the material of choice for sustainable construction. Stress-free and proven in planning, natural and microplastic-free in production, flexible in use and durable over its entire life cycle. Hot-dip galvanized steel supports the energy and transport infrastructure in our country and is the ideal companion for the sustainable serial construction of tomorrow. If you would like to find out more about this promising marriage, come along to our Masterclass. We look forward to seeing you there.

11:30 AI in Construction - Learning from Fiber Option Expansion

At a time of increasing challenges, the construction industry is facing pressure to develop innovative solutions to become more efficient and future-proof. In this presentation, we will discuss the importance of data science and artificial intelligence (AI) as key technologies for transforming the construction industry. The term AI is used everywhere, but rarely are the key concepts discussed, which will be the introduction in our talk. We will show how to identify and implement specific use cases for AI in a company and present some successful examples. By combining the data science expertise of Dr. Mattis Hartwig with the industry knowledge of Oliver Prostack, we provide a holistic perspective and offer deep insights into the lessons learned from various projects.

12:00 Decarbonization in the housing industry

In order to decarbonize the property stock quickly and sustainably, prefabricated solutions for central heating are required. Air/water heat pumps can be used highly efficiently in conjunction with the existing radiators to generate regenerative heating energy, even without modernizing the building envelope.

Inner-city installation is possible if acoustic enclosures are used. However, sustainable operation of heat pumps requires the use of natural refrigerants. Gunnar Clemenz, Managing Director at dieBauingenieure, explains how climate-neutral operation can also be achieved by using the building's own electricity.
